

Buds morphometrics – How to distinguish and predict tree species with images of buds

Felix Nöbler

Bioimage Analysis and Extended Phenotyping, Dr. Christian Kappel

March 13, 2021

Overview

1 Introduction

2 Analysis workflow

3 Results

Simple form descriptors & colour
Outline analysis
Prediction

4 Discussion

5 Conclusion

Introduction

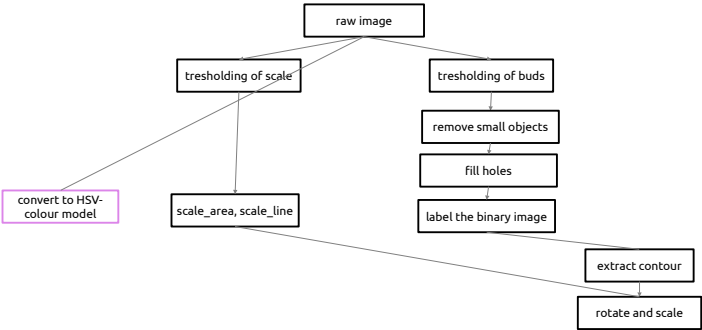

Figure: Setup for taking
images

- Goal was to describe buds with image descriptors and make species predictions
- 46 pictures of 1422 buds

Analysis workflow

- Introduction
- Analysis workflow
- Results
 - Simple form descriptors & colour
 - Outline analysis
 - Prediction
- Discussion
- Conclusion

- *Acer pseudoplatanus*, n=90
- *Aesculus hippocastanum*, n=39
- *Alnus glutinosa*, n=361
- *Carpinus betulus*, n=94
- *Fagus sylvatica*, n=191
- *Populus canadensis*, n=220
- *Quercus petraea*, n=266
- *Tilia platyphyllos*, n=161

Figure: Colours used in all following images

Figure: Principal component analysis of the complete data set

Figure: Area and major axis length of estimated ellipse of all buds

Outline analysis

Figure: Mean contours of all species reconstructed from elliptic fourier coefficients

Outline analysis

Figure: Principal component analysis of the elliptic fourier coefficients of the shape of buds

Prediction of species

Table: Result of 200 times predicting the species with the three methods, numbers for the correct assignment are given in percent \pm standard deviation

| Method | Train data | Test data |
|---------------------|----------------|----------------|
| Logistic regression | 97.4 \pm 0.3 | 95.9 \pm 0.8 |
| Decision Tree | 99.3 \pm 0.3 | 92.8 \pm 1.3 |
| Random Forest | 99.9 \pm 0.1 | 96.2 \pm 0.9 |

Prediction of species

Figure: Importance of image descriptors for the decision tree

Discussion

- Segmentation of buds was done on a white paper

Discussion

- Segmentation of buds was done on a white paper
- Test performance of prediction with higher number of species, buds from different localities

Discussion

- Segmentation of buds was done on a white paper
- Test performance of prediction with higher number of species, buds from different localities
- Do the colour values show real differences?

Discussion

- Segmentation of buds was done on a white paper
- Test performance of prediction with higher number of species, buds from different localities
- Do the colour values show real differences?
- Lengths from estimated ellipse $<>$ lengths from shape

Conclusion

- Used setup worked overall well, prediction showed high accuracy

Conclusion

- Used setup worked overall well, prediction showed high accuracy
- next steps:
 - analyse images taken directly on the tree outside
 - add more species
 - add pictures from more locations
 - implement convolutional network / deep learning approach

Conclusion

- Used setup worked overall well, prediction showed high accuracy
- next steps:
 - analyse images taken directly on the tree outside
 - add more species
 - add pictures from more locations
 - implement convolutional network / deep learning approach
- most important features: overall size (e.g. major axis length), colour values (e.g. mean saturation) and the ratio between the minor and the major axis length
